

MineDriller

*The player plays as a miner, equipped with a large drill.
Levels are based in abandoned mines and untouched, mineral-rich areas.*

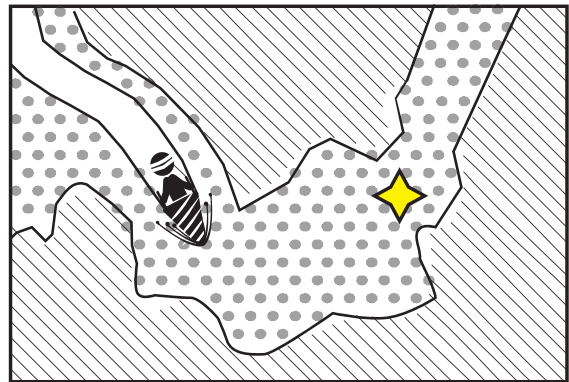

mines

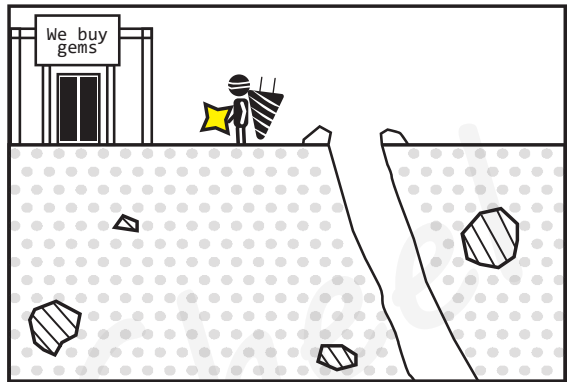

rock drilling

As the miner drill to make pockets and discover the hidden ores and precious rocks and find your way up again to sell collected ores and gems for upgrades to go deeper in the next run and earn more.

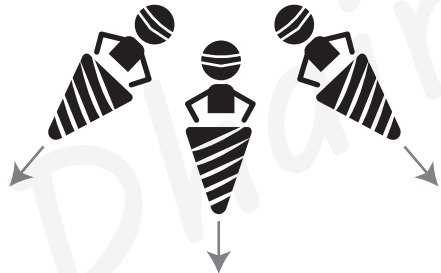

Deep ores

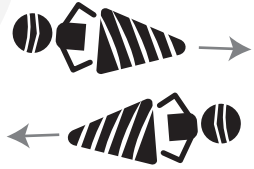

Shop

Upgrading is a critical part of the game, as all the collected ores are used to upgrade or buy things from a shop on the surface.

Drill Movement

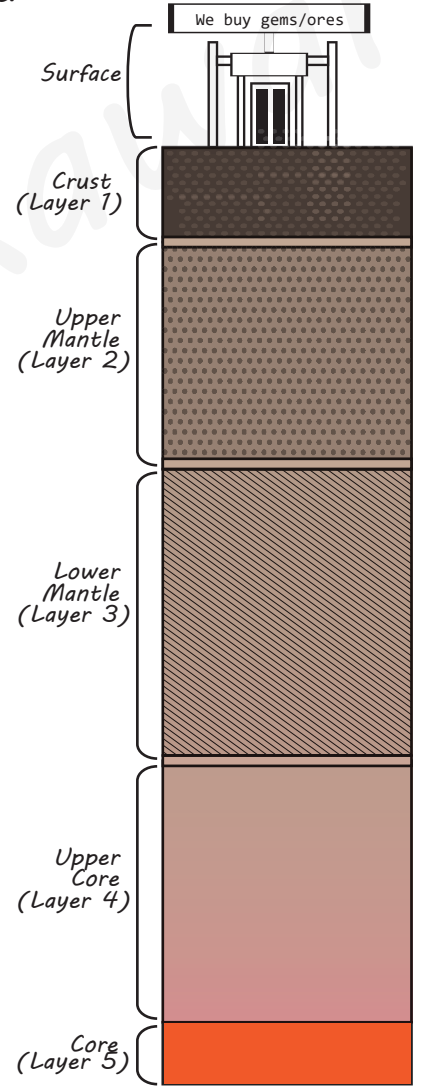

Downwards

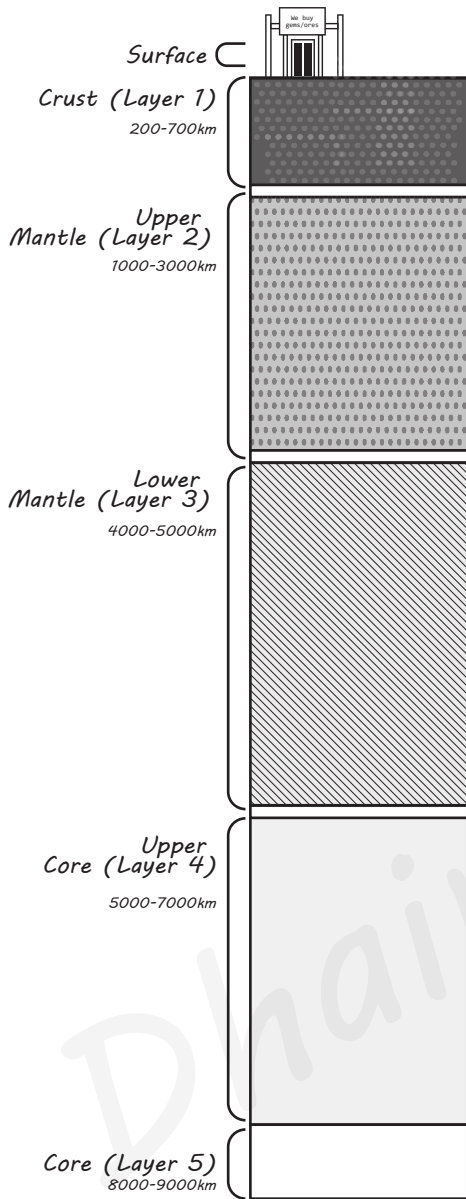

Sideways

Upwards

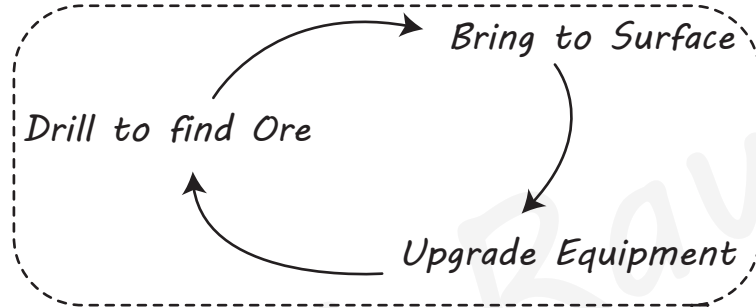

Depths possible in each run, with upgrading the drill

Upgrading the drill increases the size and life of the cooldown timer

Core loop:

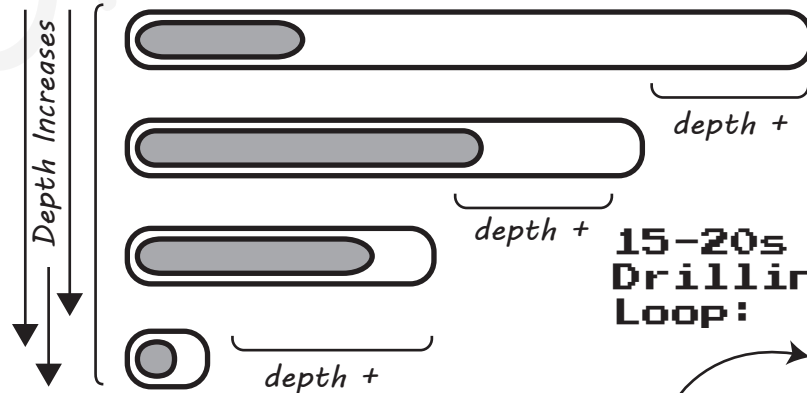

Replayability

Replayability

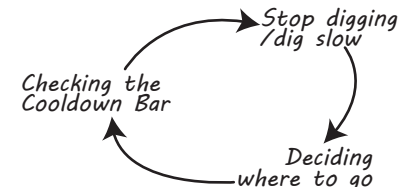

for the player to explore the level and upgrade then re-explore the area, to find more hidden areas.

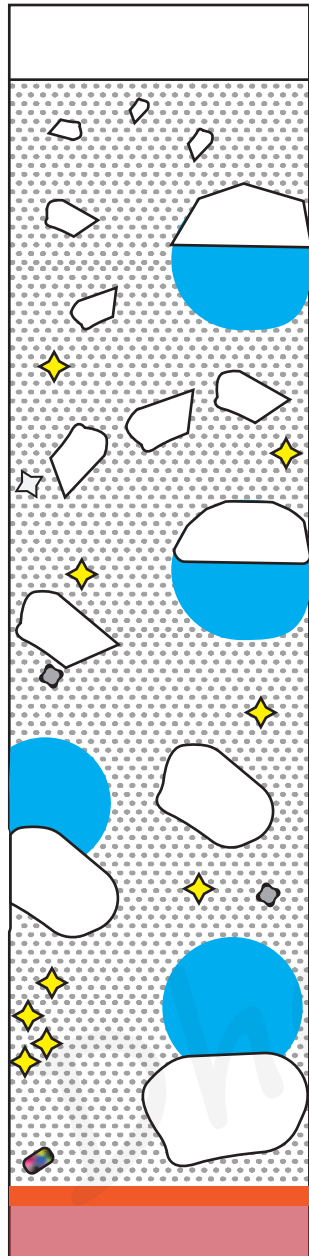

As you dig deeper
 (as you can acc. to drill heat cooldown)
 more \$\$\$ Rewards
 Find Rare ores to upgrade and explore more

Cooldown Timer

Crawly

Mine on
foot scenario

Drilling with government drillers

Battling Lava near core layer

Win Condition

Complete multiple dives, to get enough resources to upgrade, unlock next level and discover resource codex.

Reward: All collected resources and codex

Lose Condition

Drill overheats blows up, caught by govt driller, imprisoned by spider, caught by miners, bitten by zombies.

Penalty: Lose All collected resources, back to surface

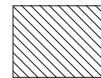

Drill Upgrades

Makes the drilling speed faster

Adds more agility to move sideways while drilling.

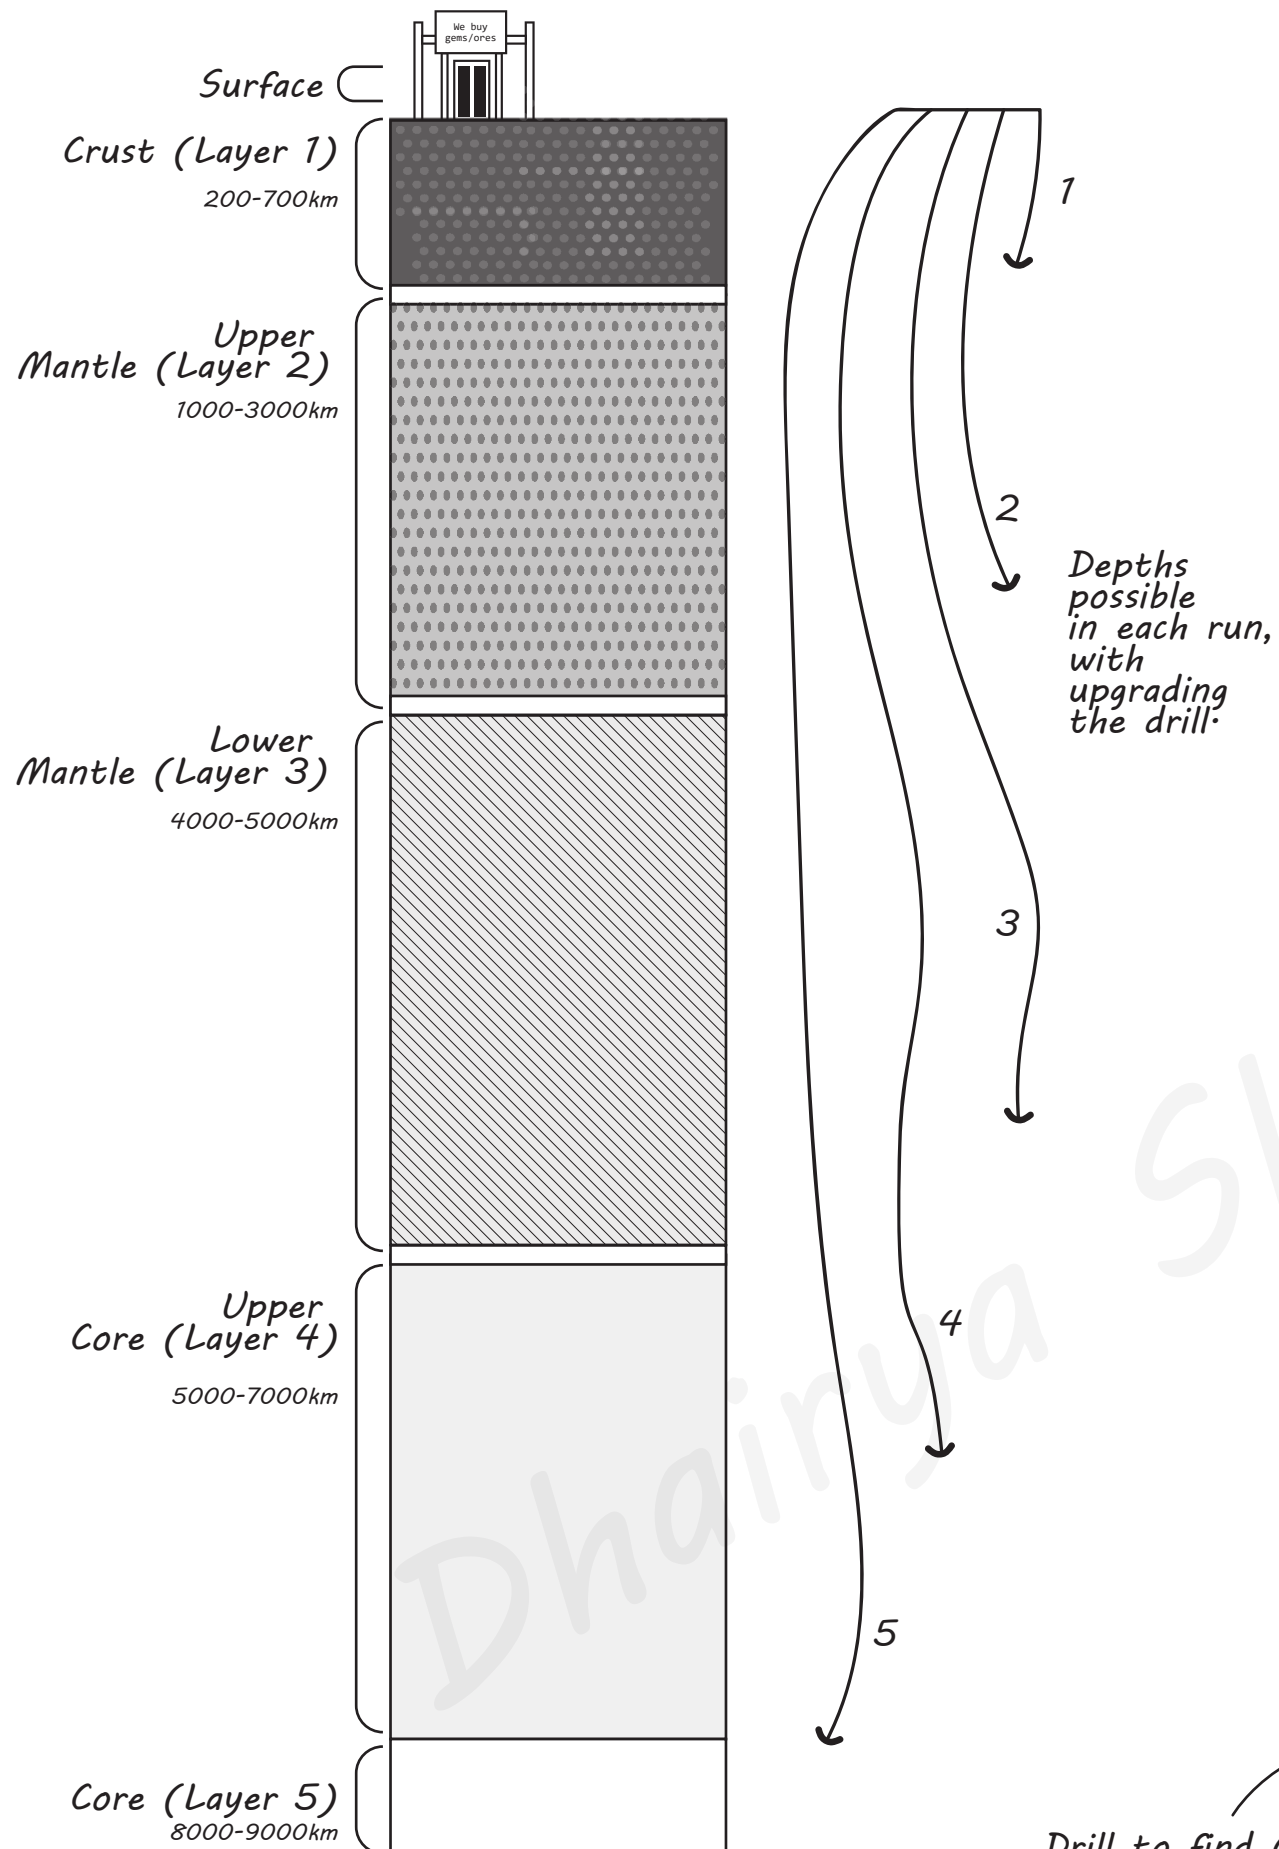

Upgrading the bit of the drill, can add drilling hard rocks, this gives the player the chance to revisit levels and areas with more explorable parts.

Reducing speed of cooldown, the drill overheats when drilling hard rocks, or continuously for long time.

Level Segmentation

How the Game would work

The player starts with drilling from the surface, in the current state of the drill, he can reach the bottom of the crust level, not be able to get into the upper mantle layer. So the player will explore the first layer freely, collecting ores/minerals to sell at the shop on the surface.

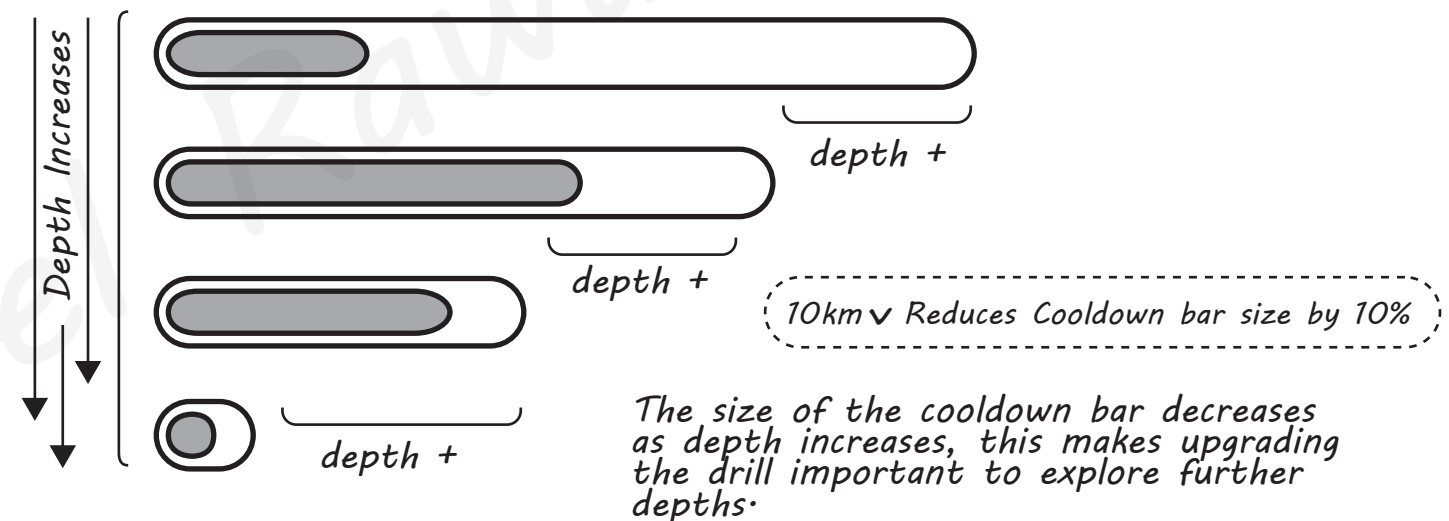

Upgrading the drill once will provide player with 250% more depth than before, hence the player would be able to reach the bottom of the Upper Mantle layer.

The player will have to collect resources and get to the surface to upgrade to go deeper.

An amount of resources to collect would be highlighted on the HUD as a target for the player.

Cooldown of Drill and how it affects the gameplay

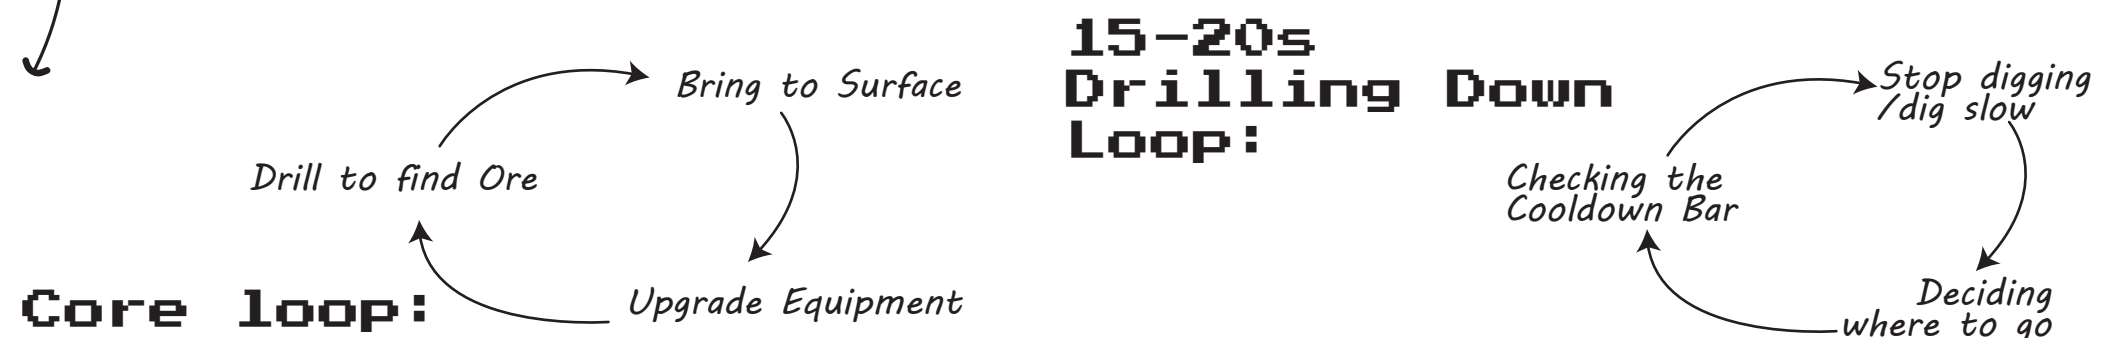

The Drill needs to cooldown because continuous drilling is not possible, this would give players time to think and choose the direction where they want to go.

Why? Heat causes problems to the drill to run continuously.

Heat increases as depth increases

The game starts with the cooldown bar big, it reduces in size as player goes deeper, continuous drilling increases the bar and puts the player at a halt for sometime till the bar goes back down. So the right way to drill would be to be aware of the cooldown and drill in moderation and think of where to go.

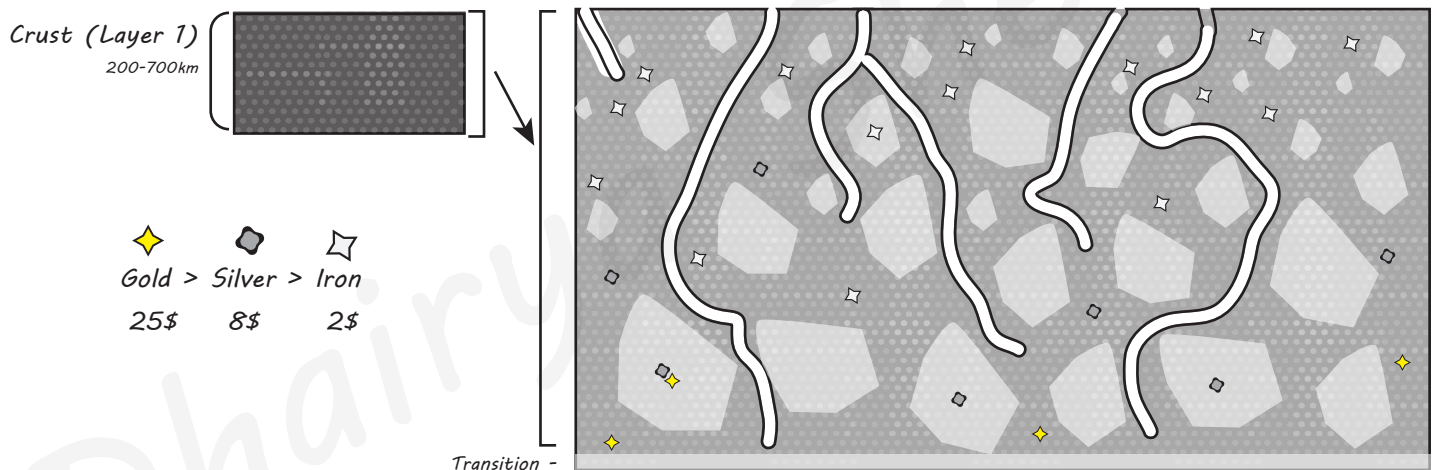

Level Design Ideology

Fun with repetition,
Narrow ways with big rewards

There are specific segments in the depth,
within which there are set parameters

Adhering to set depths of each level, elements inside each level
would be procedurally placed,
offering a new experience in everytime.

These would be hard rock, caves, ores, rare gems and enemies.

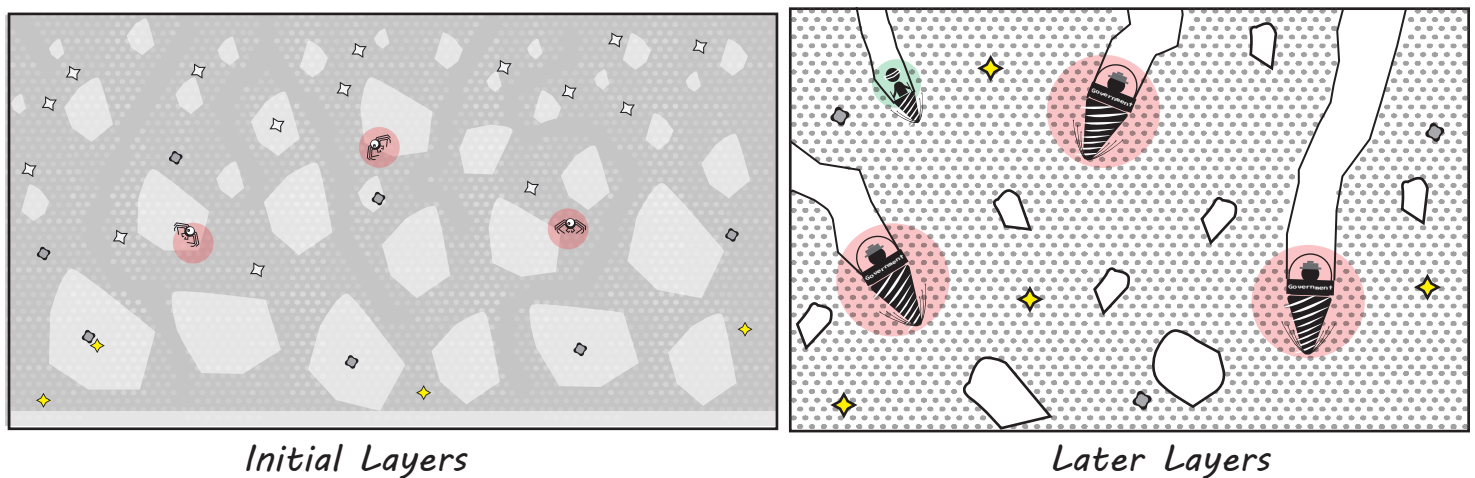

Ore/ Mineral Distribution

As we would go deeper in a layer, the bottom part will have more rare ores
near the transition to the next layer.

Enemies

Initial layers will have ways to get around the enemies, the later layers will
have enemies blocking the way.

Increasing complexity of enemies

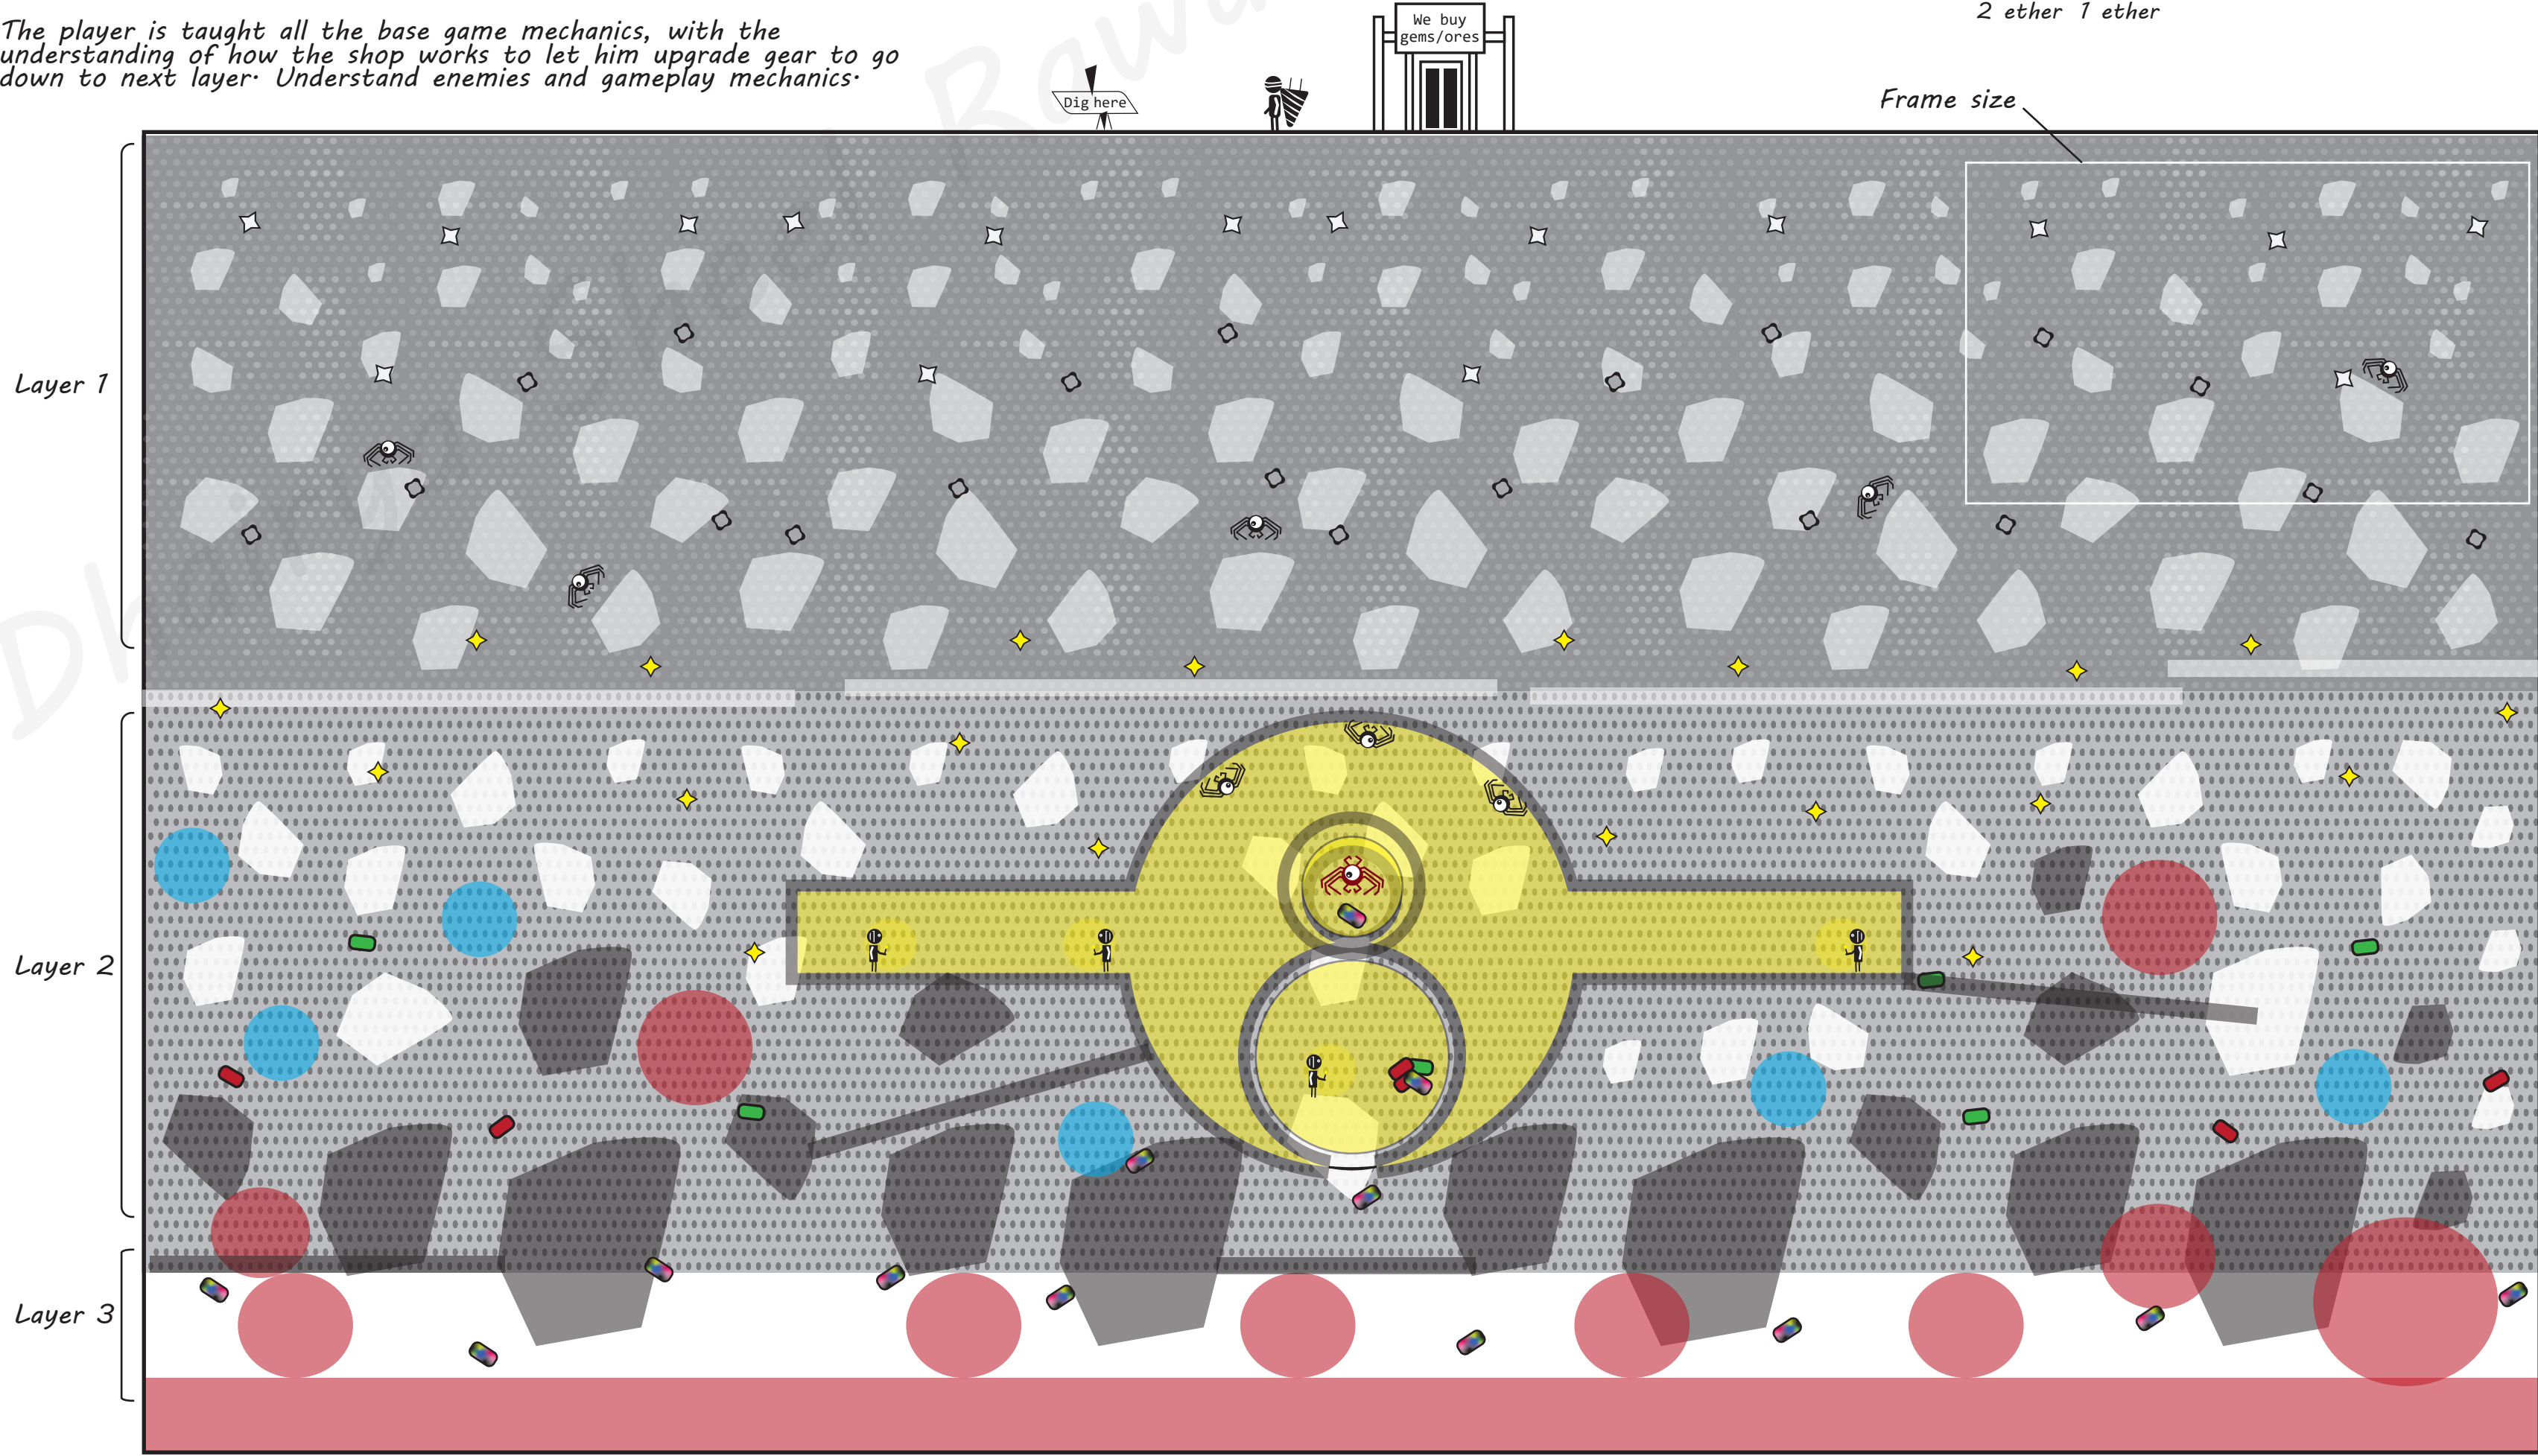

LEVEL 1 - TUTORIAL

3 Layers

Objective

The player is taught all the base game mechanics, with the understanding of how the shop works to let him upgrade gear to go down to next layer. Understand enemies and gameplay mechanics.

					
Black Opal	Ruby	Emerald	Gold	Silver	Iron
150\$	60\$	40\$	25\$	8\$	2\$
2 ether	1 ether				

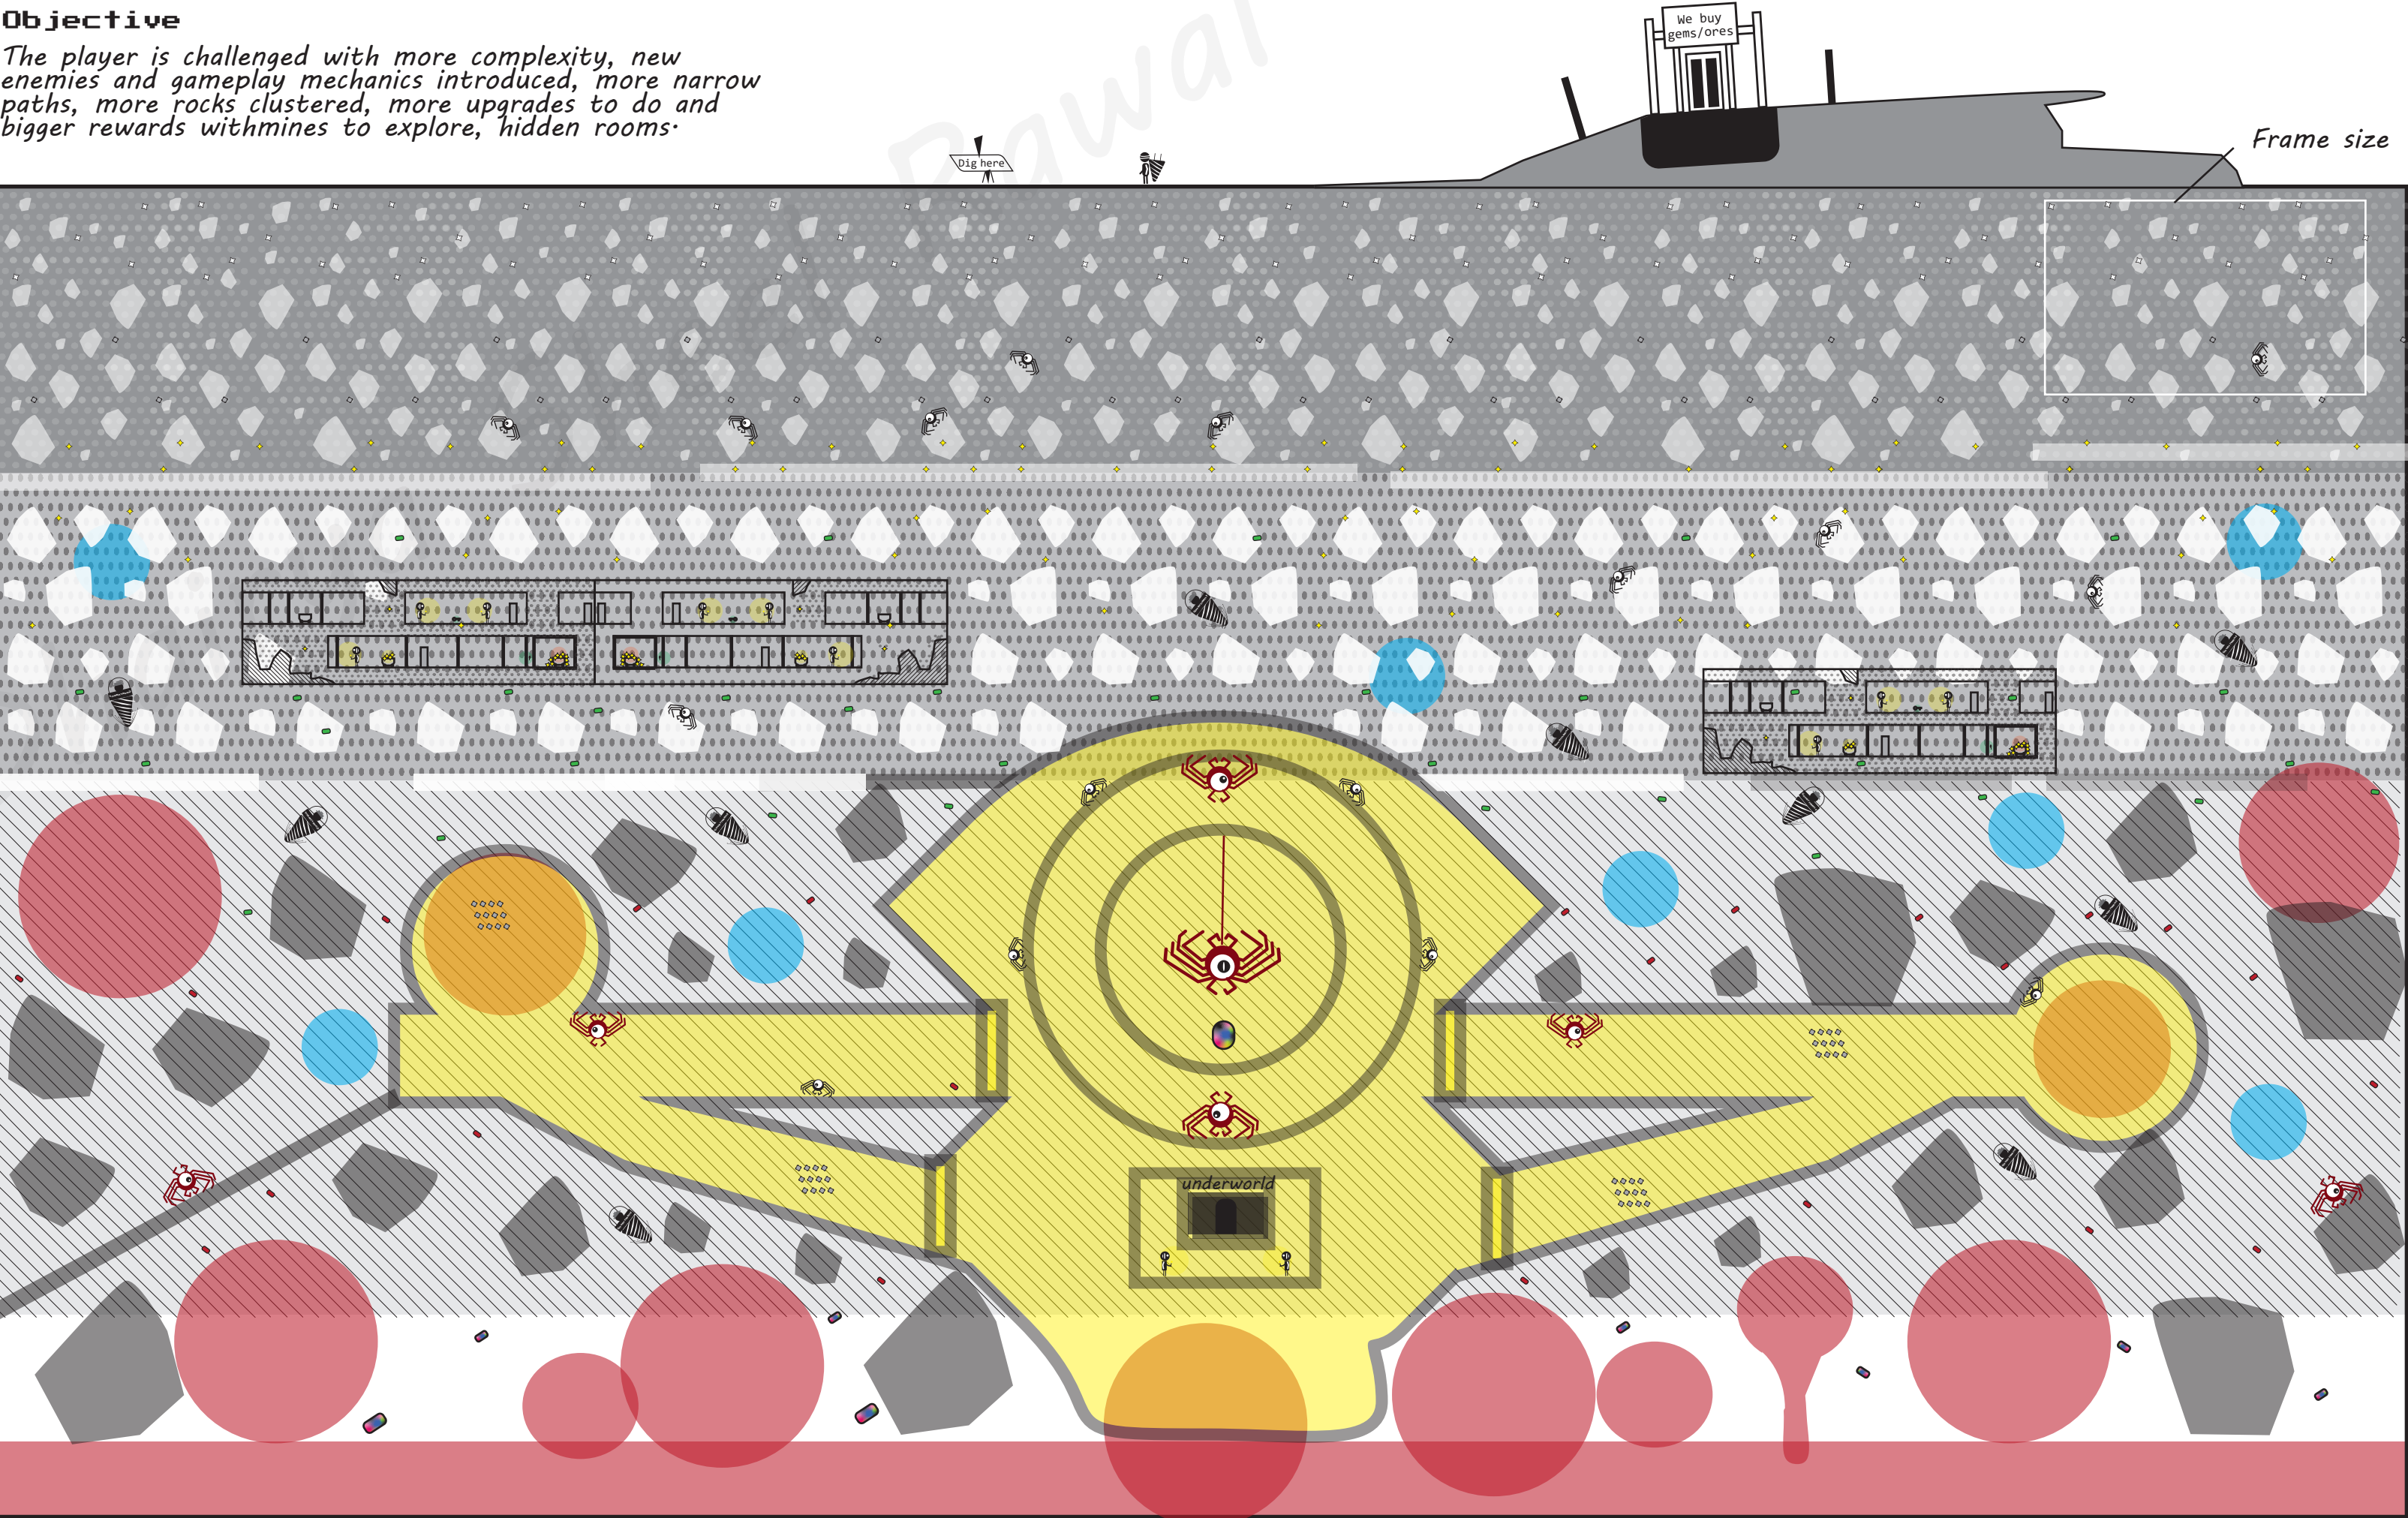

LEVEL 2

4 Layers

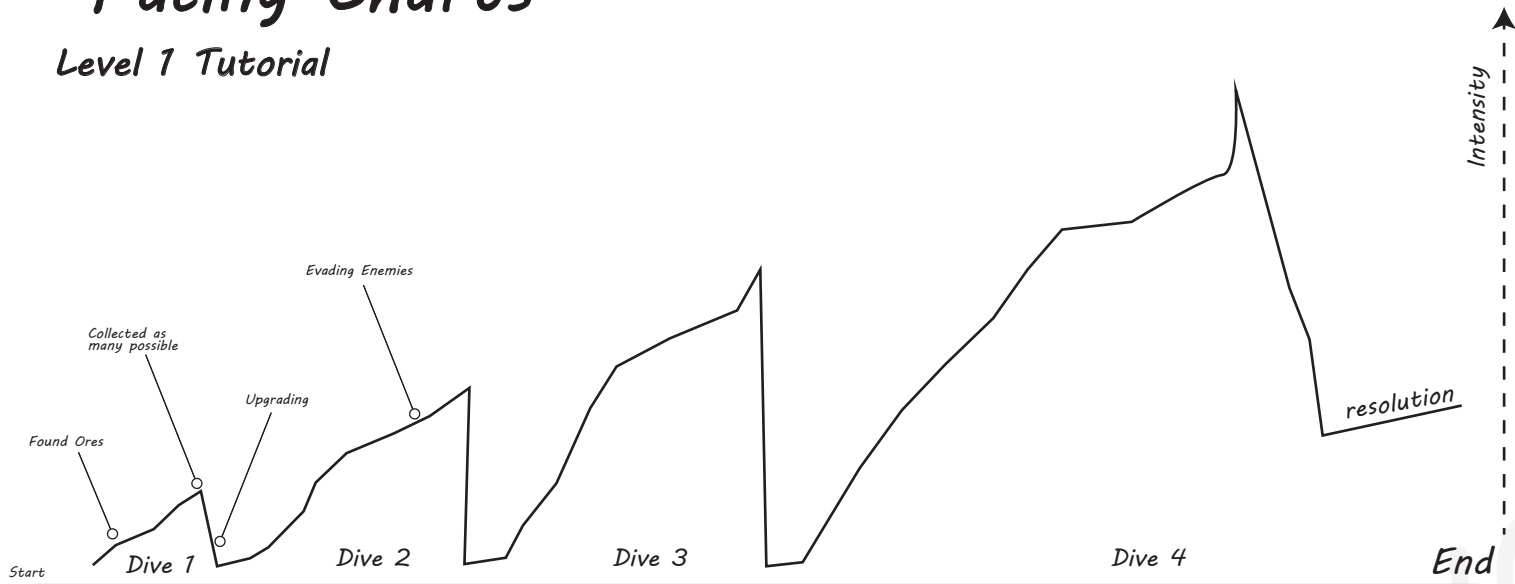

Objective

The player is challenged with more complexity, new enemies and gameplay mechanics introduced, more narrow paths, more rocks clustered, more upgrades to do and bigger rewards with mines to explore, hidden rooms.

Pacing Charts

Level 1 Tutorial

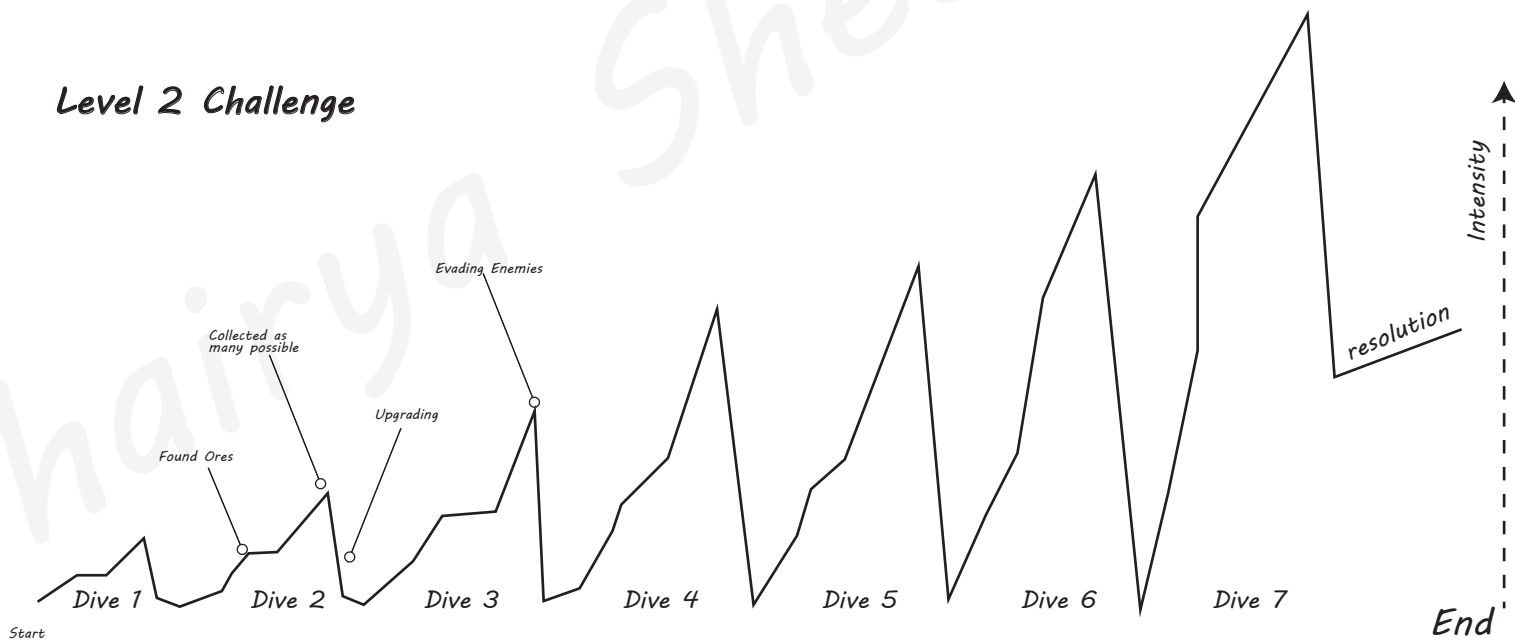

Since its a game with replayability, the game's main core loop will decide the pacing, as with each upgrade, the experience will become better and more intensive.

Intended Player Experience

To have fun learning the mechanics, being curious to explore, having fun moving around enemies and defeating them, feeling diving multiple times worth it, being rewarded fairly and learning new things about Earth's geology.

Level 2 Challenge

The second level also has hidden rooms that can be accessed by upgrading and fighting enemies. The level is more intensive, as it has more to explore like NPCs, secrets of the depth, difficult enemies.

Intended Player Experience

To have fun being challenged in the game by the enemies and environment, conquering all enemies, having fun diving again and again to explore more than before. Being rewarded in game and getting a trophy for completing the level.

Vision

To make this game addicting for the player, bringing joy and geological answers. Being on mobile should be accessible (ios, android) this bring in community challenges and online events for multiplayer digs.

Systems to Develop using unity engine or Godot engine

Cooldown Timer (as explained in previous slides)

The functionality of the cooldown timer; shrinking with increase of depth and drill blowing up as the timer fills up.

Procedural Placement of elements (auto-gen. of Levels)

Placing specific ores and rocks according to the layer they are in, as explained in previous pages. Coming up with chance % of each element to balance out the game and fun, making sure its not that easy and not that difficult to attain \$\$ for next upgrade.

Drilling Movement Mechanic

Movement mechanics, Drilling mechanics, making way, going up different than going down, not drilling into hard rocks, setting up upgrade system to unlock drilling into hard rocks, setting up limitations and constraints.

Setting up base enemy and procedural spawning

Setting up a base standard for stationary enemies, enemies that chase the player, patrolling enemies, mini bosses etc. Spawning them similar to spawning ores.

Ore pickups and currency conversion

Setting up a base standard for pickup of ores and rare gems, calculating \$\$ in realtime, to be notified once the target for next upgrade is met, the player can go back to the surface.

Setting up HUDs and UI

The cooldown timer, depth, \$ holding evaluation all to be added to the HUD, need to make UI for main menu and pause menu.

Timeline 4-6 months

*Allocated budget and plan of launching on PC, iOS and Android
Adding ADs to the game, monetizing in game currency*

thank you
